

INSTRUCTION

AIDS Prevention Education

The curriculum and materials used in the AIDS education program may be the model curricula and resources available through SPI or, if developed by the school district, be approved for medical accuracy by the Office on AIDS accompanied by an affidavit of medical accuracy stating that the material in the district developed curricula has been compared to the model curricula for medical accuracy and that in the opinion of the district the district-developed materials are medically accurate. Upon submission of the affidavit and curricula, the district may not use these materials until the approval procedure to be conducted by the Office on AIDS has been completed.

At least one month before teaching AIDS prevention education in any classroom, the district will conduct, during convenient hours for the parents or guardians of students, at least one presentation concerning the curricula and materials that will be used for such education. The parents and guardians shall be notified of the presentation. The curricula and materials shall be available for inspection. No student may be required to participate in AIDS prevention education if the student's parent or guardian, having attended one of the district presentations, objects in writing to the student's participation.

The curriculum for AIDS prevention education shall be designed to teach students which behaviors place a person dangerously at risk of infection by the human immunodeficiency virus (HIV) and methods to avoid such risk including, at least:

The dangers of drug abuse, especially that involving the use of hypodermic needles; and the dangers of sexual intercourse, with or without condoms.

The program of AIDS prevention education shall stress the life-threatening dangers of contracting AIDS and shall stress that abstinence from sexual activity is the only certain means for the prevention of the spread or contraction of the AIDS virus through sexual contact. The instruction shall also stress that condoms and other artificial means of birth control are not a certain means of preventing the spread of the AIDS virus; and, reliance on condoms puts a person at risk for exposure to the disease.
